

## **Environmental Policy for Cerlic Controls AB**

The areas of application are mainly water systems in municipal and industrial contexts. In addition to following the current legislation, Cerlic Controls AB will contribute to a better environment by working with the Swedish National Environmental Goals (SNM). This is done by evaluating our environmental aspects against SNM and developing systems to work more environmentally friendly.

We will focus on these issues:

- To educate and raise awareness of each person's responsibility for working methods and their impact on the environment.
- Promoting service on the products to increase their lifetime.
- To promote the reuse and recycling of materials or parts of products.
- To work preventively with measures both internally and externally.
- To maintain the product's long lifetime when further developing of the products to counteract the short-lived product trend.
